

REFERME INVESTMENTS

AS-IS PROCESS

Investment Evaluation Process
February - June 2026

Document Control	Details
Document ID	RMI-ASIS-001
Version	1.0
Process	Investment Target Evaluation
Purpose	Document the conceptual current-state investment evaluation flow used as the baseline for gap analysis and TO-BE design.
Source Status	Conceptual AS-IS. The source project report provides a high-level current-state flow, not an observed SOP or validated operational workflow.
Important Control	No unsupported roles, systems, approval steps, turnaround times, thresholds or production procedures are asserted in this document.

1. Purpose

The AS-IS process establishes the current-state baseline used in the ReferMe Investments case study. It shows how an investment target moves from submission through information collection, analyst review, interpretation and preparation of an investment decision.

2. Source-Supported AS-IS Flow

Investment target submitted → Financial / operational / customer information collected → Analysts review measures → Findings interpreted → Investment decision prepared

This sequence is taken directly from the project's conceptual process model. The source does not establish the exact people, systems, documents, approval hierarchy, service levels or decision thresholds used at each step.

3. Process Steps

Step	Current-State Activity	Source-Supported Description	Output / Handoff
1	Investment target submitted	A service-business investment target enters the evaluation process.	Target available for information collection.
2	Financial / operational / customer information collected	Information relevant to financial performance, operations and customers is gathered for evaluation.	Business information available for analyst review.
3	Analysts review measures	Analysts review the available measures and business information.	Reviewed measures / analytical observations.
4	Findings interpreted	The reviewed information is interpreted to form an assessment of the target.	Interpreted findings supporting the investment assessment.
5	Investment decision prepared	The analysis is consolidated into decision-support information for the investment decision.	Investment decision prepared.

4. Conceptual Current-State Characteristics

The following characteristics are supported by the project's gap analysis. They describe the analytical limitations that motivated the target-state design; they should not be read as claims about a proprietary ReferMe operating procedure.

Current-State Area	Observed / Conceptual Gap	Business Risk Identified in Project
Evaluation criteria	Non-standard evaluation criteria	Different analysts may emphasize different metrics.
Decision linkage	Metrics not consistently linked to decisions	The dashboard or analysis can become descriptive rather than decision-oriented.
Comparability	Limited comparability across businesses	Businesses with different profiles can be difficult to compare.
Post-investment visibility	Weak post-investment visibility	Deterioration may be detected late.
Data completeness	Data completeness uncertainty	Scores or conclusions may create false confidence when evidence is weak.

5. Current-State Information Domains

The high-level AS-IS flow explicitly refers to financial, operational and customer information. The broader project data model later expands the target-state analytical domains, but those additional domains should not be assumed to be formal AS-IS inputs.

Information Domain	AS-IS Relevance
Financial	Explicitly identified in the conceptual information-collection step.
Operational	Explicitly identified in the conceptual information-collection step.
Customer	Explicitly identified in the conceptual information-collection step.

6. AS-IS Pain Points / Business Need

- Analyst judgment can be difficult to compare when evaluation criteria are not standardized.
- Individual measures do not automatically explain how they affect an investment recommendation.
- Cross-business comparison is difficult without a common scoring structure.
- Post-investment deterioration can be harder to identify without structured monitoring.
- Incomplete data can reduce confidence in an investment assessment.

7. What Is Not Established by the Source

- Named process owners or individual stakeholder names.
- Exact source systems, applications, spreadsheets or databases used in the current process.
- Exact approval hierarchy or investment committee workflow.
- Turnaround times, SLAs or process-volume metrics.
- Current scoring weights, recommendation thresholds or proprietary underwriting rules.
- Evidence that the AS-IS flow was directly observed, time-studied or formally approved.

8. AS-IS to TO-BE Transition

The AS-IS baseline is used to justify the proposed TO-BE process. The target state introduces standardized data intake, data-quality validation, 28 KPI calculations, KPI normalization, five dimension scores, an overall 0-100 Investment Score, recommendation support, portfolio monitoring and risk alerts. Those target-state controls are documented separately and should not be presented as existing AS-IS capabilities.
