

2. BPMN / Swimlane Process

Target-state process already established in the project: standardized intake -> validation -> 28 KPI calculation -> normalization -> five dimension scores -> Investment Score -> decision support -> portfolio monitoring -> risk alerts.

Lane	Step	Input	Activity	Output / Handoff
Investment Target	1	Data request	Submit standardized financial, operational and customer information	Business dataset -> Data / BI
Data / BI	2	Submitted dataset	Validate completeness, validity, consistency and required fields	Validated dataset / data-quality exceptions
Finance / Investment Analyst	3	Validated financial data	Calculate financial-strength KPIs and review financial evidence	Financial KPI results
Operations / Portfolio	4	Validated operating/customer data	Calculate/validate operating, growth and customer-health evidence	Operational/customer KPI results
Data / BI	5	Validated KPI inputs	Calculate all applicable KPIs and normalize against approved rules	Normalized KPI scores
Investment / Underwriting	6	Normalized KPI scores	Review five dimension scores and methodology exceptions	Dimension assessment
Investment / Underwriting	7	Five dimension scores	Calculate/review overall Investment Score and risk conditions	Recommendation candidate
Senior Management	8	Recommendation + supporting evidence	Review recommendation, material risks and exceptions	Decision / request further review
Operations / Portfolio	9	Approved investment	Track actual vs target, KPI trends, score and risk changes	Portfolio monitoring
Investment / Underwriting	10	Alerts / deterioration	Investigate exceptions and decide mitigation/escalation	Mitigation action / reassessment

2.1 Process Flow

START -> Investment target submitted -> Standardized data intake -> Data-quality validation -> [Data valid?] -> No: return exceptions for correction -> Yes: calculate 28 KPIs -> normalize KPI performance -> calculate five dimension scores -> calculate Investment Score -> review critical risks / data confidence -> [Sufficient evidence?] -> No: Review / request more information -> Yes: prepare Invest / Review / Reject decision support -> management decision -> if invested: portfolio monitoring -> threshold breach? -> risk alert / mitigation -> END / continue monitoring.

2.2 BPMN Gateways / Business Events

Gateway / Event	Rule
Data valid?	Required inputs must satisfy approved completeness/validity rules before a high-confidence evaluation.
Sufficient evidence?	A score should not be treated as conclusive when mandatory data is missing or data quality is weak.
Critical risk override?	A material risk condition may require manual review even when the composite Investment Score is strong.
Post-investment threshold breach?	Approved revenue, churn, margin, concentration, cash-flow or data-quality thresholds trigger investigation.
