

REFERME INVESTMENTS

GAP ANALYSIS

AS-IS vs TO-BE Investment Evaluation Process
February - June 2026

Document Control	Details
Document ID	RMI-GAP-001
Version	1.0
Purpose	Identify gaps between the conceptual current-state investment evaluation process and the proposed standardized analytics target state.
Baseline	AS-IS: target submitted → information collected → analysts review measures → findings interpreted → investment decision prepared.
Target State	Standardized data validation, 28 KPIs, five dimensions, 0-100 scoring architecture, decision support, monitoring and risk alerts.
Source Discipline	The gap analysis uses project-supported gaps and proposed capabilities. Unsupported operational metrics, systems, costs and benefits are not invented.

1. Purpose

This Gap Analysis identifies what is missing between the conceptual AS-IS process and the proposed TO-BE investment analytics framework. It links each gap to its business impact, target-state response and relevant requirement areas.

2. AS-IS Baseline

The source-supported conceptual AS-IS process is: Investment target submitted → financial/operational/customer information collected → analysts review measures → findings interpreted → investment decision prepared.

The source does not establish exact current systems, process owners, approval hierarchy, cycle time, SLAs or proprietary investment methodology.

3. TO-BE Target State

The proposed TO-BE introduces structured evaluation using 28 KPIs across Financial Strength, Operational Performance, Growth, Customer Health and Risk; normalized scoring; an overall 0-100 Investment Score; recommendation support once thresholds are approved; business-level drill-down; portfolio monitoring; risk alerts; and visible data-quality status.

4. Detailed Gap Analysis

ID	Area	AS-IS Gap	Business Impact	TO-BE Response	Traceability	Priority
GAP-01	Evaluation criteria	Non-standard evaluation criteria	Different analysts may emphasize different metrics.	Standardized 28-KPI framework across five dimensions.	BR-01, BR-02; FR-02	High
GAP-02	Decision linkage	Metrics not consistently linked to decisions	Analysis can remain descriptive rather than clearly supporting an investment decision.	Normalize KPI performance, calculate dimension scores and overall Investment Score; support recommendation after thresholds are approved.	BR-03, BR-04, BR-05, BR-06; FR-03, FR-04, FR-05, FR-07	High
GAP-03	Cross-business comparability	Limited comparability across businesses	Businesses with different profiles can be difficult to compare consistently.	Use common KPI definitions, normalization and a common 0-100 scoring architecture.	BR-01, BR-03, BR-04; FR-03, FR-04, FR-05	High
GAP-04	Post-investment visibility	Weak post-investment visibility	Deterioration may be detected late.	Portfolio Monitoring for actual-vs-target, KPI trends, score/risk changes and attention list where historical/target data exists.	BR-07; FR-09	High
GAP-05	Data completeness	Data completeness uncertainty	Scores or conclusions can create false confidence when source evidence is weak.	Measure and expose data-quality status as part of the risk framework.	BR-10; FR-12	High
GAP-06	Risk identification	No standardized early-warning analytics established in the conceptual AS-IS	Material deterioration/concentration may not be surfaced consistently.	Risk & Alerts for revenue decline, churn, margin deterioration, concentration and cash-flow signals where supporting data exists.	BR-08; FR-10	High

GAP-07	Business drill-down	Conceptual AS-IS does not establish a standardized drill-down view	Decision users may need additional effort to understand the drivers behind an assessment.	Business-level drill-down across revenue, customers, profitability, operations, growth and risk.	BR-06, BR-09; FR-07, FR-08, FR-11	Medium-High
GAP-08	Traceability	Conceptual AS-IS does not establish end-to-end requirements/test traceability	Changes or defects can be harder to connect to business intent.	BR/FR/User Story/UAT/dashboard traceability through RTM and change control.	Project governance / RTM	Medium

5. Gap Prioritization

Priority	Gap IDs	Reason
High	GAP-01, GAP-02, GAP-03, GAP-04, GAP-05, GAP-06	Directly affects evaluation consistency, decision support, comparability, monitoring, risk visibility or confidence in the data.
Medium-High	GAP-07	Improves explainability and analyst investigation of the overall assessment.
Medium	GAP-08	Strengthens delivery governance, change impact analysis and validation evidence.

Priority labels above are BA prioritization for this case study, not evidence of an approved ReferMe prioritization decision.

6. Capability Change Summary

Capability	AS-IS	TO-BE
Evaluation framework	Measures reviewed by analysts; standardized framework not established	28 defined KPIs across five dimensions
Scoring	Common scoring architecture not established	Normalized KPI values, dimension scores and proposed 0-100 overall score
Recommendation	Decision prepared; standardized recommendation thresholds not established	Invest / Review / Reject support once thresholds are approved
Explainability	Findings interpreted	Drill-down from overall score to dimensions and KPIs
Monitoring	Weak post-investment visibility identified as a gap	Actual-vs-target, KPI trends and score/risk changes where data exists
Risk	Standardized early-warning analytics not established	Risk & Alerts for defined deterioration/concentration signals
Data quality	Completeness uncertainty	Visible Data Quality Score/status within risk
Traceability	Not established in conceptual AS-IS	RTM connecting requirements, user stories, UAT and outputs

7. Dependencies / Conditions

- Final scoring weights require stakeholder validation.
- Invest / Review / Reject thresholds require approval before they can be treated as business rules.
- Historical trend, CAGR, volatility and score-change analysis require sufficient historical data.

- Actual-versus-target monitoring requires approved target data.
- Segment benchmarks and normalization logic require business validation.
- Production data sources, refresh frequency, security and SLA remain technical/governance decisions.

8. Recommended Actions

Action	Purpose	Related Gap
Validate KPI definitions and required inputs	Create a common analytical vocabulary and calculable framework.	GAP-01, GAP-03
Validate scoring/normalization methodology	Ensure the score is comparable and defensible.	GAP-02, GAP-03
Approve recommendation thresholds before operational use	Prevent proposed logic from being presented as an approved investment rule.	GAP-02
Implement visible data-quality controls	Prevent incomplete evidence from creating false confidence.	GAP-05
Establish monitoring dataset / history where available	Enable trends, actual-vs-target and score/risk change analysis.	GAP-04
Validate risk-alert rules	Make early-warning signals actionable and explainable.	GAP-06
Maintain RTM and change control	Preserve requirement-to-test/output traceability.	GAP-08

9. Expected Target-State Benefits

The target-state design is intended to provide the following benefits. These are qualitative expected benefits, not measured project outcomes:

- More consistent evaluation of investment targets.
- Improved comparability across service businesses.
- Greater transparency into why a business receives a particular score or recommendation.
- Earlier visibility of performance deterioration and risk signals where sufficient data exists.
- Greater awareness of data-quality limitations during investment decision-making.
- Stronger traceability between business needs, solution behavior and validation.
