Power BI Five-Page Decision-Support Solution
February - June 2026

Document Control		Details
Document ID	RMI-WF-001	
Version	1.0	
Purpose	Define low-fidelity page structure, visual hierarchy, filters and interactions before final Power BI implementation.	
Pages	Investment Overview; Investment Evaluation; Business Profile; Portfolio Monitoring; Risk & Alerts	
Design Rule	Wireframes specify layout and required information only. They do not invent portfolio values, thresholds, dates, locations or historical results.	
Theme	ReferMe-style navy navigation, light canvas, white cards, blue/teal/green/yellow/red semantic accents.	

1. Wireframe Design Principles

- Use one reusable selected-business context for Investment Evaluation and Business Profile; do not hard-code a separate page for each business.
- Keep portfolio-level pages focused on prioritization and exceptions rather than detailed target-level analysis.
- Use KPI cards for high-level decisions, charts for patterns/comparison, and tables for supporting evidence.
- Financial displays use USD (\$) where the underlying project data is financial.
- Recommendation, alert and score thresholds must remain configurable until approved.
- Trend, actual-vs-target and score-change visuals should only populate when sufficient historical/target data exists.
- Data-quality limitations should be visible where they can affect interpretation.

Page	Primary User Question	Level
Investment Overview	What does the investment pipeline look like?	Portfolio
Investment Evaluation	Should we invest in this selected business?	Selected business
Business Profile	What is happening inside this selected business?	Selected business
Portfolio Monitoring	How are businesses performing against expectations?	Portfolio
Risk & Alerts	Where should the team investigate first?	Portfolio / exception

2. Investment Overview Wireframe

Portfolio-level prioritization and pipeline summary

Wireframe Notes

- Portfolio-level only; do not hard-code a selected business into this page.
- Invest / Review / Reject visuals depend on approved recommendation logic.
- Summary table should enable navigation/drill-through to the selected target where implemented.

3. Investment Evaluation Wireframe

Selected-business scoring and explainability

NAVIGATION

Overview

Investment Evaluation

Business Profile

Portfolio Monitoring

Risk & Alerts

REFERME INVESTMENTS

Selected Business
[Selector]

Investment Score
0-100 Card

Recommendation
[Status Card]

Data Quality
[Status Card]

Five Dimension Scores
[Financial | Operations | Growth | Customer | Risk]

Underlying KPI Evidence
[Matrix: KPI | Value | Score | Status]

Score Driver / Risk Commentary Area
[Decision-support evidence, not invented narrative]

Wireframe Notes

- The page must respond to the business selector and work for every target.
- Dimension scores: Financial Strength, Operational Performance, Growth, Customer Health and Risk.
- Underlying KPI evidence is essential so the overall score remains explainable.
- Recommendation thresholds and KPI normalization must be approved before being treated as final business rules.

4. Business Profile Wireframe

Selected-business financial, customer, operational, growth and risk profile

Wireframe Notes

- One reusable Business Profile page should work for all businesses through filtering.
- Financial values use USD (\$) where applicable.
- Trend visuals should remain blank/hidden or clearly unavailable when sufficient history does not exist.
- No location or date should be inserted unless the source/reporting requirement explicitly needs it.

5. Portfolio Monitoring Wireframe

Portfolio performance, target comparison and change monitoring

Wireframe Notes

- Actual-vs-target requires approved target data.
- Score/risk trends require comparable historical periods.
- Do not fabricate history merely to populate the wireframe.
- The attention list should route users toward investigation, not act as an unexplained automated investment decision.

6. Risk & Alerts Wireframe

Portfolio-level early-warning and exception investigation

Wireframe Notes

- Alert logic should cover revenue decline, churn, margin deterioration, concentration and cash-flow signals where data exists.
- Threshold values remain configurable/TBD until stakeholder approval.
- Data-quality issues must be distinguishable from genuine business-risk alerts.
- Users should be able to navigate from an alert to supporting business/KPI evidence.

7. Interaction & Navigation Specification

Interaction	Requirement
Business Selector	Investment Evaluation and Business Profile must update for the selected target.
Cross-page Navigation	Persistent navigation should provide access to all five dashboard pages.
Drill-through	Portfolio summary/alert views should support navigation to supporting selected-business detail where implemented.
Filter Context	Business, time and relevant validated dimensions should behave consistently across applicable visuals.
Tooltips	May expose supporting KPI/value context; no unsupported business narrative should be generated automatically.
Empty State	When history, target or threshold data is unavailable, show a clear unavailable/TBD state rather than fabricated values.

8. Visual Component Catalogue

Component	Use
KPI Card	High-level count, score, percentage or financial value.
Status Card	Recommendation, risk or data-quality state.
Ranked Bar	Compare businesses or KPI scores.
Line Chart	Time trend only when sufficient historical data exists.
Donut / Bar Distribution	Recommendation/risk category mix.
Matrix / Detail Table	Underlying KPI evidence and traceability.
Selector / Slicer	Reusable business or period context.
Attention / Alert Table	Prioritize businesses requiring analyst investigation.

9. Wireframe-to-Requirement Traceability

Wireframe	Primary Requirements
Investment Overview	BR-05, BR-06; FR-06, FR-11, FR-12; US-01, US-05
Investment Evaluation	BR-01 to BR-06, BR-10; FR-02 to FR-05, FR-07, FR-11, FR-12; US-02, US-05
Business Profile	BR-09, BR-10; FR-08, FR-11, FR-12; US-02, US-05
Portfolio Monitoring	BR-07; FR-09, FR-11; US-03
Risk & Alerts	BR-08, BR-10; FR-10 to FR-12; US-04, US-05

10. Approval / Open Design Decisions

- Final visual chart types may change during Power BI build while preserving the information requirement.

- Final recommendation and alert thresholds require stakeholder approval.
- Historical/target availability determines which monitoring visuals can be populated.
- Final production navigation, responsive behavior, refresh, access/security and deployment remain implementation decisions.
- Final dashboard visual design should retain the approved ReferMe theme and one-page-per-dashboard structure.
