

REFERME INVESTMENTS

POWER BI REQUIREMENTS

Investment Analytics & Decision-Support Layer
February - June 2026

Document Control	Details
Document ID	RMI-PBI-001
Version	1.0
Purpose	Define the business and functional requirements for the five-page Power BI decision-support solution.
Source Basis	ReferMe Investments project report, BR-01 to BR-10, FR-01 to FR-12, US-01 to US-05, UT-01 to UT-09, KPI/scoring framework.
Important Note	This document defines reporting requirements, not final visual design or production architecture. Unsupported refresh schedules, source systems, security model and thresholds remain TBD.

1. Purpose and Scope

The Power BI solution is the decision layer for the ReferMe Investments framework. It must help users evaluate investment targets, understand score drivers, inspect business performance, monitor invested businesses and identify risk signals while keeping data-quality limitations visible.

2. Core Reporting Requirements

ID	Requirement	Traceability
PBI-01	Display portfolio-level evaluation KPIs including businesses evaluated, average Investment Score and decision counts.	FR-06
PBI-02	Provide a selected-business Investment Evaluation showing overall score, five dimension scores and underlying KPI evidence.	FR-07
PBI-03	Provide a Business Profile covering revenue, customers, profitability, operations, growth and risk.	FR-08
PBI-04	Provide Portfolio Monitoring for actual-vs-target, KPI trends, score/risk changes, early warnings and attention list where supporting data exists.	FR-09
PBI-05	Provide Risk & Alerts for revenue decline, churn, margin deterioration, concentration and cash-flow signals.	FR-10
PBI-06	Allow filtering and drill-down by investment target and relevant business dimensions.	FR-11

PBI-07	Expose data-quality status alongside evaluation outputs to prevent false confidence in incomplete analysis.	FR-12
---------------	---	-------

3. Power BI Page Requirements

Page	Decision Question	Required Content	FR	US
1. Investment Overview	What does the investment pipeline look like?	Businesses Evaluated; Average Investment Score; Invest/Review/Reject; Average Risk, Growth and Financial Strength	FR-06, FR-11, FR-12	US-01, US-05
2. Investment Evaluation	Should ReferMe invest in this business?	Overall score; five dimension scores; underlying KPIs	FR-03, FR-04, FR-05, FR-07, FR-11, FR-12	US-02, US-05
3. Business Profile	What is happening inside this target?	Revenue trend, customers, profitability, operations, growth and risk	FR-08, FR-11, FR-12	US-02, US-05
4. Portfolio Monitoring	How are investments performing after investment?	Actual vs target; KPI trends; score/risk changes; early warnings; attention list	FR-09, FR-11	US-03
5. Risk & Alerts	Where should the investment team investigate?	Revenue decline, churn, margin deterioration, concentration and cash-flow signals	FR-10, FR-11, FR-12	US-04, US-05

4. Page-Level Functional Requirements

4.1 Investment Overview

Show number of businesses evaluated.

Show average Investment Score across the current evaluation population.

Show Invest / Review / Reject counts once recommendation thresholds are approved.

Show portfolio-level average indicators for Risk, Growth and Financial Strength.

Support navigation or drill-through to a selected business where the model permits.

Show data-quality status or limitation where evaluation evidence is incomplete.

4.2 Investment Evaluation

Show the selected investment target.

Show the overall 0-100 Investment Score.

Show Financial Strength, Operational Performance, Growth, Customer Health and Risk dimension scores.

Show the underlying KPI values/scores so the overall result is explainable.

Apply only approved normalization, KPI weighting, dimension weighting and recommendation logic.

Expose data-quality limitations next to the evaluation.

4.3 Business Profile

Filter the page to the selected business rather than using a permanently hard-coded target.

Present financial information including revenue and profitability measures where available.

Present customer, operational, growth and risk measures relevant to the selected target.

Show trends only where sufficient historical data exists.

Keep the page aligned with the common business-selection context used across the solution.

4.4 Portfolio Monitoring

Show actual versus target where approved target data exists.

Show KPI trends where multiple periods are available.

Show score change and risk change across comparable periods.

Provide early-warning visibility and an attention list for businesses requiring investigation.

Do not fabricate trend, target or period comparisons when historical/target data is unavailable.

4.5 Risk & Alerts

Surface businesses breaching approved risk rules for revenue decline, churn, margin deterioration, concentration or cash-flow performance.

Identify the affected business and relevant risk indicator.

Allow the reviewer to navigate to supporting business/KPI evidence.

Alert thresholds must remain configurable/TBD until approved.

Data-quality limitations must be distinguishable from genuine business deterioration.

5. Filtering, Drill-Down and Interaction Requirements

ID	Interaction Requirement
INT-01	A user must be able to select an investment target and have relevant business-level pages update consistently.
INT-02	Filtering must support investment target and relevant business dimensions supported by the validated model.
INT-03	Summary score views must provide access to supporting dimension/KPI evidence.
INT-04	Portfolio views should preserve enough context for users to identify the business driving an alert or exception.
INT-05	Where time data exists, period filtering must support the intended trend/monitoring analysis.
INT-06	The design must not imply unsupported history, targets or segmentation when those data are absent.

6. Data and Calculation Requirements

Area	Requirement
Business Master	Use investment-target master attributes such as Business ID/type and evaluation status for identification and filtering.
KPI Calculations	Use validated financial, operational, customer and risk inputs to calculate applicable KPIs.
Normalization	Use approved scoring thresholds/methodology to normalize KPI performance.
Dimension Scores	Calculate the five dimension scores using approved KPI weights.

Investment Score	Calculate the overall 0-100 Investment Score using validated dimension weights.
Recommendation	Display Invest / Review / Reject only after recommendation thresholds are approved.
Time / Monitoring	Trend, CAGR, volatility and actual-vs-target visuals require sufficient historical or target data.
Data Quality	Expose missing/invalid/incomplete evidence through visible status or score.

7. Proposed Dimension Weighting

Dimension	Proposed Weight	Status
Financial Strength	25%	Proposed; requires stakeholder validation
Operational Performance	20%	Proposed; requires stakeholder validation
Growth	20%	Proposed; requires stakeholder validation
Customer Health	15%	Proposed; requires stakeholder validation
Risk	20%	Proposed; requires stakeholder validation

8. UAT / Acceptance Coverage

Test ID	Area	Expected Result
UT-01	KPI calculation	Applicable KPIs calculate correctly with complete valid test data.
UT-02	Dimension scoring	Dimension score equals approved weighted KPI calculation.
UT-03	Investment scoring	Overall score equals approved weighted dimension calculation.
UT-04	Recommendation	Correct Invest / Review / Reject label is returned around approved thresholds.
UT-05	Drill-down	Selected-business KPI/dimension values reconcile to summary.
UT-06	Portfolio trend	Actual-vs-target and score/risk changes display correctly with multiple periods.
UT-07	Risk alert	Relevant warning appears for the affected business after an approved threshold breach.
UT-08	Business profile	Financial, customer, operations, growth and risk views filter correctly for the selected target.
UT-09	Data quality	Data-quality status declines and the limitation is visible when required inputs are missing/invalid.

9. Non-Functional / Governance Requirements

Business logic must remain traceable to approved BRs, FRs, KPI definitions and scoring methodology.

Thresholds, weights and benchmark assumptions must not be hard-coded as final business rules before approval.

Dashboard calculations must reconcile to the underlying KPI/scoring logic used in UAT.

Any change to KPI definitions, scoring, recommendation rules or alert logic should be impact-assessed through change control and RTM.

Production refresh frequency, authentication, access control, row-level security, SLA and deployment architecture remain TBD unless separately approved.

10. Open Items Requiring Validation

Final recommendation thresholds.

Final normalization / benchmark rules by KPI and segment.

Final scoring weights if the proposed 25/20/20/15/20 model changes.

Confirmed availability of historical data for monitoring and trend pages.

Confirmed target data for actual-vs-target comparison.

Final production source systems and refresh cadence.

Security/access model and named report owners.
