

REFERME INVESTMENTS

Power BI-Ready Data Model + DAX Measure Pack + Visual Specification

Investment Analytics & Decision Support | Feb-Jun 2026

Item	Specification
Power BI objective	Evaluate and monitor service-business investment targets using a consistent, traceable analytical framework.
Current source	ReferMe KPI workbook: 10 illustrative investment targets, five dimension scores, Investment Score, Recommendation, KPI catalogue and assumptions.
Framework	28 KPIs across Financial Strength, Operational Performance, Growth, Customer Health and Risk.
Dashboard pages	Investment Overview; Investment Evaluation; Business Profile; Portfolio Monitoring; Risk & Alerts.
Scoring	0-100 architecture; proposed dimension weights 25% / 20% / 20% / 15% / 20%.
Important control	Weights, thresholds and sample data are illustrative assumptions until validated by business stakeholders.

1. Source Reality vs Recommended Power BI Extension

The current workbook can power the Overview and a snapshot version of Investment Evaluation immediately. It does not contain historical monthly raw data for all 28 KPIs. Therefore, the model below separates Current-State tables from Future-Ready tables.

Layer	Status	What it Supports
Investment Data	Available now	10-business snapshot; revenue, EBITDA, growth, retention, risk, five dimension scores, Investment Score, recommendation
KPI Framework	Available now	28 KPI names classified into five dimensions
Assumptions	Available now	Dimension weights plus illustrative Invest/Review thresholds
DimBusiness	Derive now	Clean business master for slicers and relationships
DimKPI	Derive now	KPI catalogue for dimension/KPI navigation
DimDate	Recommended extension	Required for trends, YoY/period comparisons and portfolio monitoring
FactBusinessMonthly	Recommended extension	Required to calculate all 28 KPIs from raw monthly values
FactTargets	Recommended extension	Required for Actual vs Target
FactKPIStatus	Optional extension	Stores KPI score/status/threshold results at business-date-KPI grain

2. Recommended Semantic Model

2.1 Model Architecture

Assumptions = disconnected parameter / methodology table

Use single-direction filtering from dimensions to facts. Avoid bi-directional relationships unless a specific analytical requirement justifies them.

2.2 Table Definitions

Table	Grain / Key	Core Columns
DimBusiness	1 row per BusinessID	BusinessID, Business Type, optional sector/geography/status
DimDate	1 row per calendar date	Date, Month, MonthNo, Quarter, Year, MonthEndDate
DimKPI	1 row per KPI	KPIKey, KPI Name, Dimension, Unit, Direction, Display Order
FactEvaluationSnapshot	1 row per BusinessID/evaluation snapshot	Revenue, EBITDA, Growth %, Retention %, Risk, 5 dimension scores, Investment Score, Recommendation
FactBusinessMonthly	1 row per BusinessID + MonthEndDate	Raw financial, operational and customer inputs required for KPI calculation
FactTargets	1 row per BusinessID + MonthEndDate	RevenueTarget, EBITDA target, customer/operational targets as approved
FactKPIStatus	1 row per BusinessID + Date + KPIKey	KPI Value, KPI Score, Status, Threshold Low/High
Assumptions	1 row per assumption	Assumption Name, Value; disconnected from model

2.3 Relationships

From	To	Cardinality	Filter
DimBusiness[BusinessID]	FactEvaluationSnapshot[BusinessID]	1:*	Single
DimBusiness[BusinessID]	FactBusinessMonthly[BusinessID]	1:*	Single
DimDate[Date]	FactBusinessMonthly[MonthEndDate]	1:*	Single
DimBusiness[BusinessID]	FactTargets[BusinessID]	1:*	Single
DimDate[Date]	FactTargets[MonthEndDate]	1:*	Single

DimBusiness[BusinessID]	FactKPIStatus[BusinessID]	1:*	Single
DimDate[Date]	FactKPIStatus[Date]	1:*	Single
DimKPI[KPIKey]	FactKPIStatus[KPIKey]	1:*	Single

3. Power Query / Data Preparation Plan

- Load Investment Data, KPI Framework and Assumptions from the source workbook.
- Reference Investment Data to create DimBusiness; keep Business ID and Business Type, remove duplicates.
- Rename Investment Data query to FactEvaluationSnapshot for semantic clarity.
- Reference KPI Framework to create DimKPI; add KPIKey/index and Display Order. Preserve the five source dimensions.
- Keep Assumptions disconnected. Convert numeric values to Decimal Number and thresholds to Whole/Decimal Number as appropriate.
- Set Growth % and Retention % as percentage data types; dimension and investment scores as decimal/whole numbers.
- When monthly raw data becomes available, append it at BusinessID + MonthEndDate grain into FactBusinessMonthly rather than adding monthly columns to the snapshot table.
- Use a proper DimDate table and mark it as the date table before enabling time-intelligence measures.

4. DAX Measure Pack - Current Source

These measures work against the current 10-business snapshot. The workbook validates to 10 businesses, 4 Invest, 4 Review, 2 Reject and an average Investment Score of approximately 75.59.

01 - Current snapshot core measures

```
Businesses Evaluated =
DISTINCTCOUNT ( 'Investment Data'[Business ID] )
```

```
Total Revenue $K =
SUM ( 'Investment Data'[Revenue ($K)] )
```

```
Total EBITDA $K =
SUM ( 'Investment Data'[EBITDA ($K)] )
```

```
Portfolio EBITDA Margin % =
DIVIDE ( [Total EBITDA $K], [Total Revenue $K] )
```

```
Average Growth % =
AVERAGE ( 'Investment Data'[Growth %] )
```

```
Average Retention % =
AVERAGE ( 'Investment Data'[Retention %] )
```

```
Average Investment Score =
AVERAGE ( 'Investment Data'[Investment Score] )
```

```
Average Financial Strength =
AVERAGE ( 'Investment Data'[Financial Strength] )
```

```
Average Operational Performance =
AVERAGE ( 'Investment Data'[Operational Performance] )
```

```
Average Growth Score =
AVERAGE ( 'Investment Data'[Growth Score] )
```

```
Average Customer Health =
AVERAGE ( 'Investment Data'[Customer Health] )
```

```
Average Risk Score =
AVERAGE ( 'Investment Data'[Risk Score] )
```

02 - Recommendation measures

```
Invest Count =
CALCULATE (
    [Businesses Evaluated],
    'Investment Data'[Recommendation] = "Invest"
)
```

```

Review Count =
CALCULATE (
    [Businesses Evaluated],
    'Investment Data'[Recommendation] = "Review"
)

Reject Count =
CALCULATE (
    [Businesses Evaluated],
    'Investment Data'[Recommendation] = "Reject"
)

Invest Rate % =
DIVIDE ( [Invest Count], [Businesses Evaluated] )

Review Rate % =
DIVIDE ( [Review Count], [Businesses Evaluated] )

Reject Rate % =
DIVIDE ( [Reject Count], [Businesses Evaluated] )

High Risk Count =
CALCULATE (
    [Businesses Evaluated],
    'Investment Data'[Risk] = "High"
)

High Risk Rate % =
DIVIDE ( [High Risk Count], [Businesses Evaluated] )

```

03 - Selected business measures

```

Selected Business =
SELECTEDVALUE ( 'Investment Data'[Business Type], "All Businesses" )

Selected Business ID =
SELECTEDVALUE ( 'Investment Data'[Business ID], "Multiple" )

Selected Investment Score =
SELECTEDVALUE ( 'Investment Data'[Investment Score] )

Selected Recommendation =
SELECTEDVALUE ( 'Investment Data'[Recommendation], "Multiple" )

Selected Risk =
SELECTEDVALUE ( 'Investment Data'[Risk], "Multiple" )

Selected Revenue $K =
SELECTEDVALUE ( 'Investment Data'[Revenue ($K)] )

Selected EBITDA $K =
SELECTEDVALUE ( 'Investment Data'[EBITDA ($K)] )

Selected EBITDA Margin % =
DIVIDE ( [Selected EBITDA $K], [Selected Revenue $K] )

Selected Growth % =
SELECTEDVALUE ( 'Investment Data'[Growth %] )

Selected Retention % =
SELECTEDVALUE ( 'Investment Data'[Retention %] )

```

04 - Ranking and comparison

```

Investment Rank =
RANKX (
    ALLSELECTED ( 'Investment Data'[Business ID] ),
    [Average Investment Score],
    ,
    DESC,
    DENSE
)

Portfolio Score Difference =
VAR CurrentScore = [Average Investment Score]
VAR PortfolioAverage =
    CALCULATE (
        [Average Investment Score],
        ALL ( 'Investment Data'[Business ID], 'Investment Data'[Business Type] )
    )

```

```
)  
RETURN  
    CurrentScore - PortfolioAverage  
  
Top Investment Score =  
MAXX (  
    ALLSELECTED ( 'Investment Data' ),  
    'Investment Data'[Investment Score]  
)  
  
Lowest Investment Score =  
MINX (  
    ALLSELECTED ( 'Investment Data' ),  
    'Investment Data'[Investment Score]  
)
```

5. DAX Measure Pack - Scoring, Recommendation & Alerts

The source framework proposes a 0-100 investment scoring approach. The workbook contains illustrative weights of Financial 25%, Operational 20%, Growth 20%, Customer Health 15% and Risk 20%, with illustrative Invest and Review thresholds. Keep these values parameterized until formally approved.

05 - Assumption-driven scoring

-- Recommended: load Assumptions as a disconnected table.
 -- Values in the existing workbook are illustrative and require stakeholder validation.

```
Financial Weight =
COALESCE (
    LOOKUPVALUE (
        Assumptions[Value],
        Assumptions[Scoring Assumption], "Financial Strength Weight"
    ),
    0.25
)

Operational Weight =
COALESCE (
    LOOKUPVALUE (
        Assumptions[Value],
        Assumptions[Scoring Assumption], "Operational Performance Weight"
    ),
    0.20
)

Growth Weight =
COALESCE (
    LOOKUPVALUE (
        Assumptions[Value],
        Assumptions[Scoring Assumption], "Growth Weight"
    ),
    0.20
)

Customer Health Weight =
COALESCE (
    LOOKUPVALUE (
        Assumptions[Value],
        Assumptions[Scoring Assumption], "Customer Health Weight"
    ),
    0.15
)

Risk Weight =
COALESCE (
    LOOKUPVALUE (
        Assumptions[Value],
        Assumptions[Scoring Assumption], "Risk Weight"
    ),
    0.20
)

Recalculated Investment Score =
[Average Financial Strength] * [Financial Weight]
+ [Average Operational Performance] * [Operational Weight]
+ [Average Growth Score] * [Growth Weight]
+ [Average Customer Health] * [Customer Health Weight]
+ [Average Risk Score] * [Risk Weight]

Invest Threshold =
COALESCE (
    LOOKUPVALUE (
        Assumptions[Value],
        Assumptions[Scoring Assumption], "Invest Threshold"
    ),
    80
)

Review Threshold =
COALESCE (
    LOOKUPVALUE (
        Assumptions[Value],
        Assumptions[Scoring Assumption], "Review Threshold"
    ),
    65
)
```

```

Dynamic Recommendation =
VAR Score = [Recalculated Investment Score]
RETURN
    SWITCH (
        TRUE(),
        ISBLANK ( Score ), BLANK(),
        Score >= [Invest Threshold], "Invest",
        Score >= [Review Threshold], "Review",
        "Reject"
    )

```

06 - Alert measures

```

Risk Alert Flag =
VAR RiskBand = SELECTEDVALUE ( 'Investment Data'[Risk] )
VAR Score = [Average Investment Score]
RETURN
    SWITCH (
        TRUE(),
        RiskBand = "High", 1,
        Score < [Review Threshold], 1,
        0
    )

Risk Alert Label =
SWITCH (
    TRUE(),
    SELECTEDVALUE ( 'Investment Data'[Risk] ) = "High", "High risk",
    [Average Investment Score] < [Review Threshold], "Low investment score",
    "No critical alert"
)

Decision Priority =
SWITCH (
    TRUE(),
    [Risk Alert Flag] = 1, "Immediate review",
    [Average Investment Score] >= [Invest Threshold], "Investment candidate",
    "Standard review"
)

```

09 - Dynamic labels

```

Dashboard Subtitle =
"Portfolio snapshot | " & FORMAT ( [Businesses Evaluated], "0" )
    & " businesses evaluated"

Evaluation Title =
"Investment Evaluation - " & [Selected Business]

Score Label =
IF (
    ISBLANK ( [Selected Investment Score] ),
    "Select one business",
    FORMAT ( [Selected Investment Score], "0.0" ) & " / 100"
)

```

6. Future-Ready 28-KPI Calculation Layer

The formulas below are implementation templates. They require monthly raw fields that are not present in the current source workbook. Do not claim these KPIs were calculated from the current dataset until those source columns exist.

6.1 Required Monthly Raw Inputs

Area	Recommended Fields
Financial	Revenue, COGS, EBITDA, OperatingCashFlow, OperatingCost, LaborCost
Operations	EmployeeCount, CapacityUsed, CapacityAvailable, OnTimeServices, TotalServices
Customers	ActiveCustomers, NewCustomers, LostCustomers, RepeatCustomers, Complaints, RecurringRevenue, TopCustomerRevenue
Time & Identity	BusinessID, MonthEndDate

6.2 Financial / Operations / Growth / Customer DAX

```
-- Recommended table: FactBusinessMonthly
-- Columns: BusinessID, MonthEndDate, Revenue, COGS, EBITDA, OperatingCashFlow,
-- OperatingCost, LaborCost, EmployeeCount, CapacityUsed, CapacityAvailable,
-- OnTimeServices, TotalServices, ActiveCustomers, NewCustomers, LostCustomers,
-- RepeatCustomers, Complaints, RecurringRevenue, TopCustomerRevenue.
```

```
Revenue =
SUM ( FactBusinessMonthly[Revenue] )
```

```
Revenue PM =
CALCULATE ( [Revenue], DATEADD ( DimDate[Date], -1, MONTH ) )
```

```
Revenue PY =
CALCULATE ( [Revenue], DATEADD ( DimDate[Date], -1, YEAR ) )
```

```
Revenue Growth % =
DIVIDE ( [Revenue] - [Revenue PY], [Revenue PY] )
```

```
Gross Profit =
[Revenue] - SUM ( FactBusinessMonthly[COGS] )
```

```
Gross Margin % =
DIVIDE ( [Gross Profit], [Revenue] )
```

```
EBITDA =
SUM ( FactBusinessMonthly[EBITDA] )
```

```
EBITDA Margin % =
DIVIDE ( [EBITDA], [Revenue] )
```

```
Operating Cash Flow =
SUM ( FactBusinessMonthly[OperatingCashFlow] )
```

```
Cash Flow Margin % =
DIVIDE ( [Operating Cash Flow], [Revenue] )
```

```
Revenue per Employee =
DIVIDE (
    [Revenue],
    AVERAGE ( FactBusinessMonthly[EmployeeCount] )
)
```

```
Operating Cost % =
DIVIDE (
    SUM ( FactBusinessMonthly[OperatingCost] ),
    [Revenue]
)
```

```
Labor Cost % =
DIVIDE (
    SUM ( FactBusinessMonthly[LaborCost] ),
    [Revenue]
)
```

```
Capacity Utilization % =
DIVIDE (
    SUM ( FactBusinessMonthly[CapacityUsed] ),
    SUM ( FactBusinessMonthly[CapacityAvailable] )
)
```

```

On-Time Service % =
DIVIDE (
    SUM ( FactBusinessMonthly[OnTimeServices] ),
    SUM ( FactBusinessMonthly[TotalServices] )
)

Customer Growth % =
VAR CurrentCustomers = SUM ( FactBusinessMonthly[ActiveCustomers] )
VAR PriorCustomers =
    CALCULATE (
        SUM ( FactBusinessMonthly[ActiveCustomers] ),
        DATEADD ( DimDate[Date], -1, YEAR )
    )
RETURN
    DIVIDE ( CurrentCustomers - PriorCustomers, PriorCustomers )

New Customer Acquisition =
SUM ( FactBusinessMonthly[NewCustomers] )

Recurring Revenue % =
DIVIDE (
    SUM ( FactBusinessMonthly[RecurringRevenue] ),
    [Revenue]
)

Average Revenue per Customer =
DIVIDE (
    [Revenue],
    SUM ( FactBusinessMonthly[ActiveCustomers] )
)

12-Month Revenue CAGR =
VAR RevenueStart =
    CALCULATE ( [Revenue], DATEADD ( DimDate[Date], -12, MONTH ) )
RETURN
    IF (

        [Revenue Growth %] < 0
        || [Customer Churn %] > [Churn Alert Threshold]
        || [Margin Deterioration] < 0
        || [Customer Concentration %] > [Concentration Alert Threshold]
    )
)

```

7. Page 1 - Investment Overview

Decision question: What does the investment pipeline look like?

Zone	Visual	Fields / Measures	Purpose
Header	Slicers	Business Type, Risk, Recommendation; later Date	Scope portfolio
KPI row	Card	Businesses Evaluated	Pipeline size
KPI row	Card	Average Investment Score	Portfolio quality
KPI row	Card	Invest Count	Ready candidates
KPI row	Card	Review Count	Due diligence queue
KPI row	Card	Reject Count	Rejected / weak candidates
Middle left	Donut or 100% stacked bar	Recommendation + Businesses Evaluated	Decision mix
Middle center	Clustered bar	Business Type + Average Investment Score	Compare targets
Middle right	Bar / column	Five average dimension measures	Portfolio strengths/weaknesses
Bottom	Matrix	Business ID, Type, Score, Risk, Growth %, Retention %, Recommendation	Actionable investment queue

- Sort the business ranking by Investment Score descending.
- Use conditional formatting on score and risk, but keep semantic meaning consistent.
- Tooltip: Revenue, EBITDA, EBITDA Margin, Growth, Retention and five dimension scores.

8. Page 2 - Investment Evaluation

Decision question: Should ReferMe invest in the selected business?

Zone	Visual	Fields / Measures	Purpose
Header	Single-select slicer	Business Type or Business ID	Force one target
Hero KPI	Card / gauge	Selected Investment Score	Overall decision signal
Hero KPI	Card	Selected Recommendation	Invest / Review / Reject
Hero KPI	Card	Selected Risk	Risk band
Dimension strip	5 cards	Selected Financial, Operational, Growth, Customer Health, Risk score	Explain overall score
Left	Radar-style alternative: clustered bar	Dimension + Dimension Score	Comparable 5-dimension profile
Right	Cards	Revenue, EBITDA, EBITDA Margin, Growth %, Retention %	Business fundamentals
Bottom	Matrix	KPI Dimension, KPI, Value, Score, Status (when FactKPIStatus exists)	Underlying evidence

- Avoid a radar chart if it requires a custom visual; a horizontal bar chart is easier to audit and compare.
- Add a methodology tooltip explaining that scoring weights and thresholds are configurable assumptions pending approval.

9. Page 3 - Business Profile

Decision question: What is happening inside this investment target?

Zone	Visual	Current Source	Future-Ready Source
Header	Business slicer	Business ID / Type	Business + Date
KPI cards	Financial fundamentals	Revenue, EBITDA, EBITDA Margin	Revenue, Gross Margin, EBITDA Margin, OCF, Cash Flow Margin
Trend 1	Line chart	Not supported by snapshot	Revenue / EBITDA by Month
Trend 2	Line chart	Not supported by snapshot	Active Customers / Customer Growth by Month
Operations	Bar/cards	Operational Performance score	Revenue/Employee, Capacity Utilization, On-Time Service
Customer	Cards	Retention % + Customer Health score	Retention, Churn, Repeat Rate, Complaints, Concentration
Detail	Table	Current snapshot fields	Monthly KPI detail

Because the current dataset is a single snapshot, do not fabricate trend lines. Display current-state cards until monthly history is available.

10. Page 4 - Portfolio Monitoring

Decision question: How are investments performing after investment?

Visual	Measures	Data Requirement
Actual vs Target line/column	Revenue vs Target, Revenue vs Target %	FactBusinessMonthly + FactTargets
Score trend line	Investment Score Monthly, Investment Score Change	Historical scores
Risk trend	Risk score / risk status over time	Historical FactKPIStatus or evaluation snapshots
Exception matrix	Business, metric, actual, target, variance, alert	Monthly actuals + targets
Attention card	Businesses Requiring Attention	Threshold table + monthly KPI values

- This page is a future-ready specification; the current snapshot does not provide post-investment history.

11. Page 5 - Risk & Alerts

Decision question: Where should the investment team investigate?

Alert	Measure / Rule	Recommended Visual
Revenue declining	Revenue Growth % < approved threshold	Alert table + sparkline
High churn	Customer Churn % > approved threshold	Alert table
Margin deterioration	Margin Deterioration < approved threshold	Variance bar
Customer concentration	Customer Concentration % > approved threshold	Bar + alert
Cash-flow weakness	Cash Flow Margin / Cash Flow Risk	Card + trend
Data quality issue	Data Quality Score below threshold	Warning card / matrix
Snapshot fallback	Risk = High OR Investment Score < Review threshold	Current-source alert table

Threshold values beyond the existing illustrative Invest/Review score thresholds must be supplied and approved by stakeholders.

12. Report Navigation & Interaction Specification

Feature	Specification
Navigation	Five page buttons: Overview Evaluation Business Profile Portfolio Monitoring Risk & Alerts
Slicer sync	Sync Business Type / Business ID across evaluation pages where useful; keep single-select on Evaluation
Drill-through	From Overview business row/bar to Investment Evaluation using BusinessID
Tooltip page	Business Snapshot: Revenue, EBITDA, Growth, Retention, Risk, Investment Score
Bookmarks	Optional Methodology / Definitions panel; avoid bookmarks for core filtering
Cross-filtering	Business ranking filters dimension scores and detail matrix; disable interactions that create confusing empty states
Reset	Add Reset Filters button if bookmarks are used
Accessibility	Use descriptive titles, tab order, alt text, sufficient contrast and non-color status labels

13. Measure Formatting & Display Standards

Measure Type	Format
Revenue / EBITDA	\$0.0K for current workbook; use \$0.0M if future raw values are in dollars and scale warrants
Percentages	0.0%
Scores	0.0
Counts	0
Recommendation	Text
Variance	Signed value; % variance as +0.0%;-0.0%;0.0%
Ranks	0

14. Validation Checklist

- Businesses Evaluated = 10 for the current illustrative snapshot.
- Recommendation counts reconcile to Invest 4, Review 4, Reject 2.
- Average Investment Score reconciles to approximately 75.59.
- Average dimension scores reconcile approximately to Financial 77.8, Operational 77.9, Growth 78.0, Customer Health 81.2 and Risk 63.9.
- Recalculated score is checked against the source Investment Score using the current assumption weights.
- Every visual uses measures, not implicit aggregations, for controlled business logic.
- No monthly trend visual is shown until dated monthly records exist.
- All threshold-driven alerts disclose or reference the approved threshold source.
- Recommendation logic and risk logic remain separate; a strong investment score must not hide a critical risk condition.

15. Interview-Ready Explanation

I structured the Power BI solution as a governed semantic model rather than building visuals directly on a flat spreadsheet. The current snapshot supports portfolio overview and business-level investment evaluation, while the model is designed to extend to monthly actuals, targets and KPI status without redesigning the report. I separated dimensions such as Business, Date and KPI from fact tables, created explicit DAX measures for portfolio scores, recommendations, rankings and alerts, and kept scoring assumptions in a disconnected parameter table so business stakeholders can validate weights and thresholds. I also specified five decision-oriented Power BI pages: Investment Overview, Investment Evaluation, Business Profile, Portfolio Monitoring and Risk & Alerts. Where historical raw data was unavailable, I documented future-ready calculations rather than manufacturing trends or unsupported KPI values.

Appendix A - 28 KPI Framework

Dimension	KPI
Financial Strength	Revenue
Financial Strength	Revenue Growth %
Financial Strength	Gross Margin %

Financial Strength	EBITDA Margin %
Financial Strength	Operating Cash Flow
Financial Strength	Cash Flow Margin %
Operational Performance	Revenue per Employee
Operational Performance	Operating Cost %
Operational Performance	Labor Cost %
Operational Performance	Capacity Utilization %
Operational Performance	On-Time Service %
Operational Performance	Operational Efficiency Score
Growth	Customer Growth %
Growth	New Customer Acquisition
Growth	Recurring Revenue %
Growth	Average Revenue per Customer
Growth	12-Month Revenue CAGR
Customer Health	Customer Retention %
Customer Health	Customer Churn %
Customer Health	Repeat Customer Rate
Customer Health	Customer Complaint Rate
Customer Health	Customer Concentration %
Risk	Revenue Volatility
Risk	Customer Concentration Risk
Risk	Margin Deterioration
Risk	Cash Flow Risk
Risk	Data Quality Score
Risk	Overall Business Risk Score
