

REFERME INVESTMENTS

RAID LOG

Risks, Assumptions, Issues & Dependencies Register
February - June 2026

Document Control	Details
Document ID	RMI-RAID-001
Version	1.0
Purpose	Maintain project-level visibility of risks, assumptions, issues and dependencies affecting the ReferMe Investments analytics framework.
Source Basis	ReferMe Investments project report and supporting project artifacts.
Evidence Discipline	Only source-supported RAID items are recorded as project facts. Unsupported owners, dates, probability scores, issue events or closure outcomes are not invented.
Review Principle	RAID items should be reviewed throughout requirements, scoring validation, Power BI build, UAT and handover.

1. RAID Management Approach

The RAID Log supports proactive project governance by separating potential future threats (Risks), planning conditions (Assumptions), current confirmed problems (Issues) and external prerequisites (Dependencies). The source provides explicit risks, assumptions and dependencies. It does not establish a separate confirmed issue log; therefore the Issues register remains open for actual project evidence.

RAID Type	Definition
Risk	An uncertain event or condition that may negatively affect project or decision quality.
Assumption	A condition treated as true for planning/design until validated.
Issue	A problem that has already occurred and requires action or decision.
Dependency	An external input, approval, capability or activity required for successful delivery.

2. Risk Register

ID	Risk	Potential Impact	Mitigation / Control	Status
R-01	Scoring weights are not validated.	Business ranking may be misleading.	Calibrate the model and perform sensitivity testing.	Open / validation required
R-02	Different business models may require different benchmarks.	A common benchmark may create unfair comparison across business profiles.	Use segment-aware benchmarks where required and validated.	Open / validation required
R-03	Source data may be incomplete.	KPI reliability and decision confidence may be weak.	Apply data-quality controls and expose a confidence / Data Quality status.	Open
R-04	A composite Investment Score may hide a weak dimension.	A business may appear attractive despite a material weakness.	Always expose dimension/KPI drill-down and define override rules where approved.	Open / governance required

3. Risk Treatment Notes

- R-01 links directly to the proposed scoring methodology and the need for stakeholder-approved weights.
- R-02 should be resolved through benchmark governance rather than by silently applying one threshold to dissimilar business models.
- R-03 is addressed through the Data Quality Score/status requirement and missing/invalid/duplicate/stale input controls.
- R-04 is addressed by Investment Evaluation drill-down and the requirement to expose underlying KPI evidence.

4. Assumption Register

ID	Assumption	Why It Matters	Validation Action	Status
A-01	Required financial, operational and customer data can be obtained.	Needed to calculate the 28-KPI framework and support business evaluation.	Validate data availability and ownership before production implementation.	Open / to validate
A-02	A 0-100 scoring scale is acceptable for investment evaluation.	Enables KPI normalization, dimension scoring and an overall comparable Investment Score.	Confirm stakeholder acceptance during scoring-methodology review.	Open / to validate

5. Dependency Register

ID	Dependency	Purpose / Impact	Dependency Area	Control	Status
D-01	Power BI data model and refresh capability.	Required to expose the analytical framework through the five reporting pages.	Data / BI implementation	Model and refresh design must support the approved reporting requirements.	Open
D-02	Business-approved scoring / recommendation thresholds.	Required for final normalization, recommendation and alert behavior.	Business / Investment stakeholders	Approve thresholds before final UAT acceptance for dependent scenarios.	Open

7. RAID Traceability to Project Artifacts

RAID ID	Related Artifacts	Control Area	Relevant UAT
R-01	Scoring Methodology; FRD; UAT Plan	Scoring weights / sensitivity validation	UT-02, UT-03
R-02	KPI Catalogue; Scoring Methodology; Gap Analysis	Benchmark / normalization governance	UT-01, UT-02
R-03	Data Dictionary; Data Quality Rules; FRD	Data-quality visibility and decision confidence	UT-09
R-04	Power BI Requirements; Dashboard Wireframes; RTM	Score explainability / drill-down	UT-05
A-01	Data Dictionary; Data Model; KPI Catalogue	Availability of required input domains	UT-01, UT-06, UT-08, UT-09
A-02	Scoring Methodology; Power BI Requirements	0-100 score architecture	UT-02, UT-03
D-01	Data Model; Power BI Requirements; DAX Catalogue	Reporting/model implementation	UT-05 to UT-09 as applicable
D-02	Scoring Methodology; UAT Plan; UAT Test Cases	Recommendation / alert acceptance	UT-04, UT-07

8. Review & Escalation Rules

- Review open RAID items at major requirement, scoring, dashboard and UAT checkpoints.
- A risk that actually occurs should be reclassified or linked to an Issue with evidence and an action owner.
- An assumption that is disproved should trigger impact analysis across requirements, KPI logic, scoring, Power BI design and UAT.

- A dependency that blocks execution should be reflected in the relevant UAT case as Blocked rather than bypassed with an invented value.
- Changes to approved scoring, thresholds, KPI definitions or data requirements should follow change control and RTM impact assessment.
- Named owners, due dates and closure evidence should be populated only when actually assigned/approved.
