

THE GLAMSQUAD SALON

Customer Feedback Analysis

Qualitative Evidence Supporting Profitability & Operational Diagnosis

Document Control	Details
Client	The GlamSquad Salon
Role	Business Analyst + Data Analyst
Project Period	May–Aug 2025
Feedback Sources	Google reviews, Instagram comments, WhatsApp feedback, surveys, salon records and direct conversations
Confirmed Themes	Pricing, staff behaviour, cleanliness and staff availability
Purpose	Document how customer feedback supported the quantitative root-cause analysis.
Status	Portfolio reconstruction based on confirmed engagement facts
Evidence boundary: Exact historical review counts, comments, ratings, sentiment percentages, customer identities and verbatim feedback are not retained and are not reconstructed. This document focuses on the confirmed sources, themes and analytical methodology.	

1. Purpose

The purpose of the customer-feedback analysis was to add customer-experience context to the quantitative profitability and operational analysis. Feedback was not treated as a substitute for appointment, revenue, cost or staffing data. Instead, recurring themes were used to identify or reinforce business issues that could be investigated in structured data.

2. Why Feedback Mattered

Quantitative Question	How Feedback Added Context
Were pricing decisions affecting the business?	Pricing comments provided customer-perception context for pricing and discount analysis.
Was staffing aligned with customer demand?	Staff-availability comments supported investigation of scheduling and peak-period staffing.
Could customer experience affect repeat visits?	Staff-behaviour and cleanliness themes highlighted experience factors relevant to retention/repeat behaviour.
Were operational issues visible to customers?	Feedback helped connect internal operational patterns with externally experienced service issues.
Analytical principle: Use qualitative evidence to explain and challenge quantitative findings, not to manufacture causal certainty.	

3. Confirmed Feedback Sources

Source	Type	Portfolio Treatment
Google reviews	Public qualitative feedback	Analyze themes; do not reproduce identifiable/verbatim client feedback unless permitted.
Instagram comments	Public/social qualitative feedback	Use for recurring theme context; keep separate from transactional data.
WhatsApp feedback	Direct/private customer feedback	Sanitize completely; do not expose phone numbers or identifiable messages.
Surveys	Structured/semi-structured feedback	Use themes/responses where available and sanitized.
Salon records	Internal feedback notes/records	Use as supporting internal qualitative evidence.
Direct conversations	Verbal customer feedback	Capture only supported themes; do not invent quotations.

4. Feedback Analysis Workflow

Workflow: Collect/reference feedback → remove identifying information → preserve source channel → review content → assign supported themes → compare recurring themes → triangulate with operational data → convert supported findings into recommendations.

Step	Method
1. Source identification	Identify the available feedback channels and the type of evidence each contains.
2. Privacy review	Remove customer names, phone numbers and other identifying information from portfolio material.
3. Content review	Read/review feedback for recurring operational and commercial concerns.
4. Theme coding	Assign feedback to a consistent theme only where the content supports it.
5. Cross-source comparison	Check whether similar concerns appear across more than one feedback source where evidence exists.
6. Quantitative triangulation	Compare themes with appointment, staffing, pricing, repeat-customer or other structured analysis.
7. Recommendation linkage	Use the combined evidence to support practical management actions.

5. Confirmed Theme Framework

Theme	Confirmed?	Business Question
Pricing	Yes	Did customers perceive pricing/value as a concern, and did this align with pricing/service-economics analysis?
Staff behaviour	Yes	Were customer interactions/service experience affecting satisfaction and potentially repeat behaviour?
Cleanliness	Yes	Was the physical/service environment creating a customer-experience concern?
Staff availability	Yes	Were customers experiencing capacity/scheduling constraints that aligned with staffing analysis?
No invented ranking: The exact frequency or rank of these four themes is not retained. The portfolio therefore does not state that one theme was 'most common' or assign percentages.		

6. Theme Analysis — Pricing

Confirmed theme: Pricing concerns appeared in customer feedback.

Pricing feedback was relevant because the quantitative project also investigated service pricing, potential underpricing, discount levels and service economics. These are different perspectives: customer feedback reflects perceived value/price, while the commercial analysis examines whether pricing supports profitability.

Evidence Layer	Interpretation
Customer feedback	Provides customer perception of pricing/value.
Service pricing data	Provides the business's price information.
Discount data	Shows realized commercial adjustments where available.
Service revenue / direct cost analysis	Supports service-economics assessment where cost attribution is reliable.
Combined interpretation	Pricing decisions should balance customer value perception with sustainable service economics.
Important distinction: Customer comments that pricing feels high do not prove that prices are commercially too high. Likewise, identifying potential underpricing in the financial analysis does not invalidate customer price sensitivity. Both perspectives should inform pricing decisions.	

7. Theme Analysis — Staff Behaviour

Confirmed theme: Staff behaviour was a recurring feedback theme.

Staff-behaviour feedback added a customer-experience dimension to the staff analysis. The quantitative analysis considered stylist revenue, appointments, utilization, working hours, repeat customers and other available indicators, while feedback provided qualitative context about the service interaction.

Quantitative View	Qualitative View	Management Use
Appointments / workload	Customer experience with staff	Avoid evaluating staff on revenue alone.
Revenue by stylist	Behaviour/service perception	Review commercial and service-quality context together.
Repeat customers	Customer willingness to return	Investigate whether experience may be relevant to repeat behaviour without claiming unsupported causation.

8. Theme Analysis — Cleanliness

Confirmed theme: Cleanliness appeared in customer feedback.

Cleanliness is primarily an operational/customer-experience issue rather than a direct financial KPI. However, it can be important in a salon environment because customer experience can influence satisfaction and future visits.

Analysis Position	Treatment
Direct financial evidence	No direct causal financial percentage is claimed.
Customer-experience evidence	Cleanliness is retained as a confirmed recurring theme.
Operational implication	Management should review cleaning/operational standards where feedback indicates a concern.
Retention connection	May be considered when interpreting repeat-customer behaviour, but causation should not be asserted without evidence.

9. Theme Analysis — Staff Availability

Confirmed theme: Staff availability appeared in customer feedback.

This theme had a particularly useful connection to the structured operational analysis because the quantitative work identified insufficient staffing during peak periods and underutilized staff at other times.

Qualitative Evidence	Quantitative Evidence	Root-Cause Interpretation
Customers raised staff-availability concerns.	Peak-period understaffing was identified.	Customer experience and operational data point toward a capacity-alignment issue.
Availability concern is customer-facing.	Some staff were underutilized in other periods.	The issue is not simply staff quantity; scheduling/alignment matters.
Availability affects service access.	Scheduling problems were identified.	Demand-based scheduling is a relevant recommendation direction.
Triangulation example: Staff availability is a strong example of using two evidence types together: customer feedback indicates the experienced problem, while appointment/staffing analysis investigates the operational mechanism.		

10. Qualitative–Quantitative Triangulation Matrix

Feedback Theme	Structured Analysis to Compare	What the Combination Can Support	What It Cannot Prove Alone
Pricing	Service prices, discounts, service mix, service economics	Pricing/value is a decision area requiring both customer and commercial consideration.	Exact optimal price or causal profit effect.
Staff behaviour	Stylist activity/revenue, repeat customers, feedback context	Staff evaluation should include service-quality context, not revenue alone.	That behaviour caused a specific retention/profit percentage.
Cleanliness	Repeat behaviour / customer experience context	Operational standards may require management attention.	That cleanliness caused a measurable financial loss.
Staff availability	Appointments, peak demand, working hours, utilization, scheduling	Capacity/scheduling alignment is a supported operational issue.	Exact number/value of lost appointments without retained evidence.

11. Feedback-to-Recommendation Traceability

Theme	Recommendation Direction	Business Rationale
Pricing	Review pricing and promotion/discount strategy.	Balance customer value perception with sustainable service economics.
Staff behaviour	Include customer-experience context in staff performance/coaching decisions.	Commercial output alone does not represent the full service experience.
Cleanliness	Strengthen/maintain operational cleanliness standards where needed.	Address a confirmed customer-experience concern.
Staff availability	Align staff schedules more closely with demand periods.	Respond to both customer availability concerns and confirmed peak/off-peak staffing mismatch.

12. Feedback and Repeat-Customer Analysis

Repeat-customer behaviour was analyzed using phone-number data. Feedback themes can provide context for why customers may or may not return, but the historical data retained for the portfolio does not support assigning a specific retention change to an individual feedback theme.

Evidence rule: Use language such as 'may influence', 'provides context' or 'supports investigation' unless a direct causal relationship was actually measured.

13. Privacy & Confidentiality Controls

- Do not publish customer names or phone numbers.
- Do not publish private WhatsApp messages verbatim.
- Do not expose identifiable survey responses or internal salon notes.
- Do not invent direct customer quotations.
- Redact or paraphrase any portfolio examples if source text could identify a person.
- Keep public/social feedback analysis focused on aggregate themes rather than individual customers.
- Keep feedback data separate from confidential commercial transaction values.

14. Validation Rules

Control	Validation Rule
Theme consistency	Use a defined theme list and apply categories consistently.
Source traceability	Retain source/channel metadata in the protected analysis layer where available.
No double counting	If the same feedback appears in multiple captured sources, avoid treating it as multiple independent items.
Ambiguous feedback	Do not force unclear feedback into a theme.
PII check	Verify public outputs contain no identifiable customer data.
Quantitative claims	Do not convert themes into percentages unless the underlying sanitized feedback dataset supports the calculation.
Causal language	Do not claim a feedback theme caused a specific financial result without direct evidence.

15. Portfolio Feedback Data Structure

Proposed Field	Purpose	Status
Feedback_ID	Sanitized logical identifier.	Portfolio rebuild field
Feedback_Date	Date where available.	Logical/optional
Feedback_Source	Google, Instagram, WhatsApp, survey, salon record or direct conversation.	Based on confirmed source categories
Feedback_Text_Sanitized	Redacted/paraphrased content for demonstration if needed.	Portfolio-only; no identifiable text
Feedback_Theme	Pricing, staff behaviour, cleanliness, staff availability or another evidence-supported category.	Derived
Sentiment_Label	Optional classification if implemented in a sanitized rebuild.	Not claimed historically
Related_Staff_Key	Optional sanitized staff association where valid.	Conditional

16. What Is Confirmed vs Not Retained

Classification	Details
Confirmed	Feedback sources: Google reviews, Instagram comments, WhatsApp feedback, surveys, salon records and direct conversations.
Confirmed	Themes remembered: pricing, staff behaviour, cleanliness and staff availability.
Confirmed	Feedback analysis was part of the profitability/operational diagnosis.
Portfolio reconstruction	Formal theme-coding workflow, field names, validation matrix and sanitized feedback-table design.
Not retained	Exact review/comment count, exact theme frequency, ratings, sentiment percentages, verbatim comments, customer identities and historical theme-ranking.
Not claimed	That any one feedback theme caused a specific percentage of churn, revenue loss or profit change.
