

THE GLAMSQUAD SALON

Power Bi Requirements

Management Reporting Solution | Profitability & Operational Analytics

Document Control	Details
Client	The GlamSquad Salon
Role	Business Analyst + Data Analyst
Project Period	May–Aug 2025
Primary Stakeholder / User	Salon manager
Confirmed Deliverable	Power BI dashboard built from scratch
Data Coverage	Approximately one year
Purpose	Define the business, analytical, functional, data and validation requirements for the portfolio Power BI solution.
Status	Portfolio reconstruction based on confirmed engagement facts
Evidence boundary: A Power BI dashboard was built from scratch in the engagement. Exact historical page names, visual layout, filters, DAX, theme, refresh architecture and original data model are not retained. Requirements below define a defensible portfolio rebuild rather than pretending to reproduce the historical dashboard exactly.	

1. Solution Purpose

The Power BI solution should give the salon manager a consolidated view of the factors affecting profitability and support decisions across pricing, services, appointments, customers, staffing, scheduling, discounts and costs.

Primary decision question: What is driving profitability, where are the operational/commercial inefficiencies, and what actions should management prioritize?

2. Business Objectives Supported

Objective	Power BI Contribution
Diagnose profitability	Show revenue, expenses, profit and relevant drivers together.
Improve appointment economics	Expose utilization, demand patterns, cancellations and no-shows.
Understand customer behaviour	Show repeat-customer and retention indicators.
Improve service/pricing decisions	Compare service activity, revenue, pricing/discount and service economics.
Improve workforce decisions	Compare stylist activity/revenue/utilization and staffing alignment with demand.
Support management action	Provide clear drill/filter paths from summary KPIs to analytical drivers.
Monitor outcome	Support consistent before/after profitability comparison where the sanitized rebuild contains the required periods.

3. Intended User

User	Primary Needs
Salon Manager	Fast management overview; identify profitability issues; compare services/stylists; understand demand/customer behaviour; use findings to support pricing, staffing, scheduling, promotion, discount and cost decisions.

4. Reporting Architecture

The portfolio solution is organized into four logical analytical pages. These labels are reconstruction choices and are not claimed as the exact historical page names.

Page	Purpose	Primary Decision
1. Executive Profitability Overview	Summarize business performance and expose major profitability drivers.	Where is profitability pressure coming from?
2. Service & Pricing Analysis	Analyze service mix, service revenue, pricing, discounts and service economics.	Which service/pricing decisions require attention?
3. Staff Performance & Utilization	Analyze stylist contribution, workload, working hours, utilization and scheduling alignment.	Is staff capacity aligned with demand and commercial output?
4. Customer & Appointment Analysis	Analyze appointments, cancellations/no-shows, repeat behaviour, retention and demand patterns.	Are appointment/customer patterns supporting profitable operations?

5. Global Functional Requirements

ID	Functional Requirement	Priority
PBI-FR-01	The report shall allow the manager to filter analysis by available date context.	High
PBI-FR-02	The report shall maintain consistent KPI definitions across all pages.	High
PBI-FR-03	Relevant visuals shall cross-filter/cross-highlight logically without creating misleading totals.	High
PBI-FR-04	The report shall provide clear navigation between the four logical analytical pages.	Medium
PBI-FR-05	KPI cards shall use documented measures from the KPI Catalogue rather than independent visual-level calculations.	High
PBI-FR-06	Percentage KPIs shall handle zero/blank denominators safely.	High
PBI-FR-07	Public portfolio visuals shall not expose customer phone numbers, customer PII or confidential original financial values.	High
PBI-FR-08	Visual titles/labels shall make the metric and reporting context understandable to a business user.	Medium
PBI-FR-09	The report shall distinguish quantitative transaction analysis from qualitative feedback context.	High
PBI-FR-10	Any portfolio-only reconstructed logic shall be documented separately from confirmed historical facts.	High

6. Page 1 — Executive Profitability Overview

Purpose: Provide the manager with an immediate view of overall commercial performance and the major factors requiring investigation.

Component	Requirement	Business Use
KPI cards	Total Revenue, Total Expenses, Profit, Profit Margin %; Profit Improvement % where before/after periods are represented.	Understand headline performance.
Profit trend	Show profit over the selected time grain where data supports trend analysis.	Identify direction/change over time.
Revenue vs expenses	Compare revenue and expenses consistently over time or selected context.	Understand whether pressure is revenue-side, cost-side or both.
Driver view	Expose relevant commercial/operational drivers such as service, staff, discount or appointment indicators.	Move from symptom to diagnosis.
Date filter	Allow time-period analysis across available history.	Support comparison and investigation.
Management annotation / insight area	Summarize supported findings without overstating causality.	Improve decision usability.
Confirmed outcome: The case-study narrative may state the retained result: profit increased by 15% within approximately two months after necessary recommendations were implemented. Underlying ₹ values remain confidential.		

7. Page 1 Acceptance Criteria

- Revenue and expense totals reconcile with the prepared analytical dataset.
- Profit equals Revenue – Expenses under the same filter context.
- Profit Margin % uses the documented KPI definition.
- Date filtering updates all relevant visuals consistently.
- No original confidential commercial values are exposed in the public portfolio.
- Any before/after comparison uses a consistent profit definition.

8. Page 2 — Service & Pricing Analysis

Purpose: Support decisions about service performance, service mix, pricing, discounts and service economics.

Component	Requirement	Business Use
Revenue by service	Compare validated service revenue.	Identify commercially important services.
Service mix	Show share of completed service activity by service/category where supported.	Understand demand composition.
Service activity	Compare completed appointments/services by service.	Separate volume from revenue effects.
Pricing / discount view	Show sanitized listed/realized price and discount indicators where rebuilt data supports them.	Investigate pricing and discount behaviour.
Service contribution/margin	Show only where direct costs can be reliably attributed.	Evaluate service economics.
Service filter	Allow selection of a service/category where meaningful.	Investigate individual service patterns.

Evidence control: The engagement considered potential underpricing, excessive discounts and stronger economics/margins for premium services. Exact historical prices, discount rates and margins are not retained and must not appear as historical facts.

9. Page 2 Acceptance Criteria

- Service names are standardized before grouping.
- Revenue by service reconciles with prepared data.
- Service mix uses a documented denominator.
- Discount measures distinguish amount/rate correctly in the sanitized rebuild.
- Service contribution/margin is suppressed or excluded when direct-cost attribution is not defensible.
- No unsupported 'optimal price' or historical margin percentage is generated.

10. Page 3 — Staff Performance & Utilization

Purpose: Provide a balanced view of stylist performance, staff cost, capacity utilization and scheduling alignment.		
Component	Requirement	Business Use
Revenue by stylist	Compare validated attributed revenue by sanitized stylist.	Understand commercial contribution.
Appointments by stylist	Compare validated completed activity.	Add workload context.
Working-hours context	Show available/actual working hours where the rebuilt data supports it.	Interpret output relative to time input.
Revenue per working hour	Calculate when both attributed revenue and working hours are reliable.	Compare commercial productivity.
Staff utilization	Calculate only with a defensible used/booked-time and available-time denominator.	Identify underused/capacity-pressure periods.
Salary / commission context	Show sanitized cost indicators where appropriate.	Interpret staff-linked cost alongside output.
Demand alignment	Compare staffing activity/availability with demand by available time dimensions.	Support scheduling decisions.
Confirmed findings: Peak-period understaffing, underutilization in other periods, major stylist revenue differences, salary/commission cost pressure and scheduling problems were identified.		
Interpretation control: Do not rank staff using revenue alone or create an arbitrary composite performance score.		

11. Page 3 Acceptance Criteria

- Staff labels are standardized/sanitized before comparison.
- Revenue is attributed to staff only where the source relationship is supported.
- Working-hours measures use validated time values.
- Utilization is not displayed when a defensible denominator is unavailable.
- Salary/commission values in public portfolio data are sanitized.
- Staff analysis supports multi-factor interpretation rather than a single-metric ranking.

12. Page 4 — Customer & Appointment Analysis

Purpose: Understand appointment activity, lost bookings, customer continuity and demand patterns.

Component	Requirement	Business Use
Total / completed appointments	Show valid appointment activity.	Understand demand and delivered services.
Cancellation rate	Show using documented eligible/booked denominator.	Quantify cancellation-related appointment loss.
No-show rate	Show using documented eligible/booked denominator.	Quantify no-show-related appointment loss.
Unique / repeat customers	Use sanitized customer identity logic.	Understand customer base and repeat behaviour.
Repeat customer rate	Show using documented denominator.	Monitor recurring customer activity.
Retention view	Show only after defining a valid portfolio retention window/eligibility rule.	Understand customer continuity.
Demand by time/day	Analyze appointment activity using available date/time fields.	Identify comparatively high-demand periods.
Feedback context	Optionally summarize confirmed feedback themes separately from transaction KPIs.	Add customer-experience context.

Confirmed matching logic: Phone-number data was used to identify repeat visits. The public report must use sanitized customer keys and never expose phone numbers.

Peak-demand boundary: The retained pattern is generally evenings and periods around major festivals. Exact historical peak hours/days are not retained.

13. Page 4 Acceptance Criteria

- Appointment-status mapping is validated before completed/cancelled/no-show measures.
- Repeat-customer logic is tested after customer deduplication/matching.
- Phone numbers and customer PII do not appear in report visuals or public datasets.
- Retention is not calculated until its rebuilt business rule is explicitly defined.
- Demand visuals do not claim exact historical peak periods beyond what the rebuilt data demonstrates.
- Qualitative feedback is visually/semantically separated from financial transaction measures.

14. KPI Requirements

KPI Group	Measures
Profitability	Total Revenue, Total Expenses, Profit, Profit Margin %, Profit Improvement %
Appointments	Total Appointments, Completed Appointments, Appointment Utilization %, Cancellation Rate %, No-Show Rate %
Customers	Unique Customers, Repeat Customers, Repeat Customer Rate %, Customer Retention Rate %
Services / Pricing	Revenue by Service, Service Mix %, Avg Revenue per Completed Appointment, Discount Amount/Rate %, Service Contribution/Margin
Staff	Revenue by Stylist, Appointments by Stylist, Revenue per Working Hour, Staff Utilization %, Commission Cost, Commission to Revenue %
Costs	Material Cost % where attribution is valid
Operations / Feedback	Peak-Demand Period and Feedback Theme Frequency where implemented
KPI source: Detailed business definitions and portfolio formulas belong in the KPI Catalogue and Data Model & DAX document. This requirements document defines what the report must communicate.	

15. Filter & Interaction Requirements

Filter / Interaction	Requirement
Date	Required where applicable; should filter relevant fact-based visuals consistently.
Service	Recommended on service/pricing and relevant cross-analysis views.
Staff / Stylist	Recommended on staff analysis; use sanitized labels publicly.
Appointment status	Useful for appointment analysis; controlled values only.
Feedback theme	Optional for qualitative feedback view/context.
Cross-filtering	Interactions must be tested to prevent misleading partial totals.
Reset / clear state	Recommended for usability in the portfolio rebuild.

16. Visual Design Requirements

- Prioritize business questions over decorative visuals.
- Use a clear hierarchy: headline KPI → trend/comparison → diagnostic breakdown.
- Avoid excessive visual density on a single page.
- Use consistent number formatting and metric naming.
- Do not use pie/donut charts where category comparison is difficult; choose a clearer visual when appropriate.
- Provide descriptive titles that state what is being measured.
- Use tooltips only when they add decision context rather than repeat visible labels.
- Keep reconstructed/sanitized nature of public data clear in portfolio materials.

17. Logical Data Model Requirements

Entity	Purpose
Customers	Sanitized customer-level identity for repeat/retention analysis.
Appointments	Core appointment/service activity and status fact.
Services	Standardized service attributes.
Staff	Sanitized staff/stylist attributes.
Staff Working Hours	Working-time/capacity context where represented.
Expenses	Expense/cost fact.
Feedback	Sanitized qualitative feedback context.
Date	Calendar dimension for consistent time analysis.
Model boundary: This is a recommended logical portfolio model, not the retained historical Power BI schema.	

18. Data Quality Requirements

- Standardize dates, service names, staff labels and appointment statuses before reporting.
- Validate revenue, expenses, discounts, salary/commission and material-cost fields before KPI calculation.
- Resolve/flag duplicate customer records before repeat-customer analysis.
- Reconcile key totals between prepared data and Power BI.
- Exclude or document ambiguous records rather than forcing unsupported classifications.
- Ensure public data is sanitized before loading into a portfolio-facing PBIX or screenshot.

19. Performance & Refresh Requirements

The exact historical refresh architecture, gateway, scheduled-refresh frequency and production deployment are not retained. For the portfolio rebuild:

Area	Portfolio Requirement
Data volume	Model should be appropriately structured for the sanitized demonstration dataset.
Refresh	Manual refresh is sufficient unless a separate portfolio automation is intentionally built.
Performance	Pages should load and filter responsively for the rebuilt dataset.
Model design	Prefer a clean star-like model and measures over duplicated visual-level logic.
Deployment	No production Power BI Service architecture is claimed unless separately implemented and documented.

20. Security & Confidentiality Requirements

- No customer phone numbers or identifiable customer data in public visuals.
- Use sanitized staff labels if individual names are not appropriate for public use.
- Do not publish original client revenue, profit, salary, commission, service-price, margin or expense values.
- Do not include identifiable private WhatsApp feedback.
- Use sanitized/reconstructed values for portfolio screenshots.
- Do not claim Row-Level Security or other production security architecture unless actually implemented.

21. Dashboard Validation & Testing

Test Area	Requirement
Revenue / expense reconciliation	Dashboard totals match prepared analytical controls.
Profit	Profit = Revenue – Expenses in the same filter context.
Appointment statuses	Completed/cancelled/no-show mappings match the cleaned dataset.
Repeat customers	Customer matching/deduplication logic produces expected repeat classification.
Service aggregation	Service revenue/activity totals reconcile.
Staff aggregation	Stylist revenue/activity/working-hours logic reconciles.
Percentages	Denominators are documented and zero/blank cases handled.
Filters	Date/service/staff/status filters update intended visuals correctly.
Cross-page consistency	Same KPI returns the same result under equivalent filter context.
Privacy	No PII/confidential original values are visible.

22. Requirements Traceability

Power BI Area	BR / User Story Link
Executive Profitability	BR-01, BR-02, BR-18 US-01
Service & Pricing	BR-07, BR-08, BR-09 US-04
Staff Performance & Utilization	BR-10, BR-11, BR-12, BR-13 US-05
Customer & Appointment	BR-03, BR-04, BR-05, BR-06 US-02, US-03
Feedback Context	BR-15 US-06
Dashboard / Recommendations	BR-16, BR-17 US-07
Validation / Confidentiality	Cross-cutting US-08

23. Definition of Done — Portfolio Dashboard

- Sanitized analysis-ready data is loaded and model relationships are validated.
- Required KPI measures are implemented using documented definitions.
- Four logical analytical pages are complete.
- Relevant filters and interactions work as intended.
- Major KPI totals reconcile with prepared data.
- Percentage denominators and blank/zero handling are tested.
- Customer PII and confidential original client values are absent.
- Visuals support a clear management decision rather than only displaying data.
- Reconstructed elements are not presented as exact historical dashboard details.
- The dashboard can be explained end-to-end in a live walkthrough.

24. Confirmed vs Reconstructed

Classification	Details
Confirmed	Power BI was used; dashboard was built from scratch; analysis covered profitability, appointments/utilization, service mix, repeat customers/retention, peak periods, staff performance, service/stylist revenue, cancellations/no-shows, pricing, costs and feedback.
Confirmed findings/outcome	Staffing/scheduling issues, stylist revenue variation, salary/commission cost pressure, pricing/discount/service-economics considerations, meaningful cancellations/no-shows, and 15% profit improvement within approximately two months.
Portfolio reconstruction	Four page names/layout concept, exact visual choices, filter design, logical data model, detailed acceptance criteria and testing controls.
Not retained	Exact original PBIX layout, DAX, Power Query steps, page names, colors/theme, refresh schedule, gateway/deployment, RLS and production architecture.
